

Discussion: Programa Saúde na Escola: Avaliação dos Efeitos em Indicadores de Saúde Sexual e Reprodutiva

Marcela Mello

Universidad de los Andes, Chile

GeFam 2025

Summary

- The paper analyzes the effect of the *Programa Saúde na Escola* on sexual and reproductive health.
- It employs a fuzzy regression discontinuity (RD) design, leveraging an eligibility criterion as a credible source of exogenous variation.
- Findings: reduction in teenage pregnancy; mixed results for STIs and maternal health outcomes.
- The study evaluates an important public policy targeting underserved populations.
- It offers a comprehensive analysis across many outcomes.

Summary

- The paper analyzes the effect of the *Programa Saúde na Escola* on sexual and reproductive health.
- It employs a fuzzy regression discontinuity (RD) design, leveraging an eligibility criterion as a credible source of exogenous variation.

- Provide figures for all main results.
- Estimated effects appear large relative to the literature.
 - Contextualize magnitudes against the literature.
 - Use local-linear specifications with fewer controls
 - Report bandwidths and kernel choices.
- Placebos: effects on pre-intervention outcomes and for older women.
- Clarify estimation of the results showing covariate balance; also present as figures.
- Strengthen the narrative so the outcomes fit a cohesive mechanism (e.g., knowledge → contraception → pregnancy; service access → prenatal care).
